

ABSTRACT

An improved isopropyl alcohol compound contains the cooling, soothing, itch-relieving, antibacterial, antifungal and deodorizing properties and herbal fragrance of pure, natural peppermint oil. Its ideal uses are for foot deodorizing and therapy, sanitizing and deodorizing the insides of shoes and various surfaces, for oily hair and scalp and dandruff therapy, spa treatment massage, and the removal of body perspiration and odor in areas that are not sensitive to isopropyl alcohol. The compound is identifiable from other alcohol compounds by its pink color, produced by small amounts of FD&C natural liquid colorings.
